

## Micropoint Stimulation

Micropoint stimulation is a holistic and natural way to treat the body and mind. MPS combines osteopathy, acupuncture and neurology to treat chronic pain and deregulate the autonomic nervous system. Dolphin Neurostim is a hand held device that uses a direct current (DC), a concentrated microcurrent which is a natural energy found in every living body. This current is what keeps your heart and nervous system functioning. Similar to the widely used PEMF systems, dolphin neurostim penetrates much deeper into the body's tissues.

Micropoint stimulation devices are most commonly used on acupuncture points to treat specific conditions. When applied to specific points the current can reduce nervous system stress and cortisol levels, resulting in muscle relaxation and the release of natural pain killing endorphins. It is delivered in a manner to "resonate" with the nervous system and influence dramatic cellular changes in organs, tissues and fascia.

MPS can be very effective in releasing surgical scars, relaxing tight muscles and pain control due to its effect on the body's nervous, muscular and endocrine system.

The dolphin devices work fast and effectively for chronic pain conditions and can provide 60-85% pain reduction within 1-3 applications.
